NOAH Multi-hazard Map is composed of a combination of landslide, flood, and storm surge hazards maps. Landslide hazard map identifies areas that may be affected by landslides; floods were simulated at a 100-year rain return scenario; and storm surge simulation was based on maximum storm tide heights of 5 meters.

An NOAH Multi-hazard Map overlayed on aerial imagery, flood, and storm surge hazard maps. This landslide hazard map identifies areas at risk of landslides; high flood risk areas; and high storm surge risk areas. These maps were developed for use in disaster management and recovery planning.
