NOAH Multi-hazard Map is composed of a combination of landslide, flood, and storm surge hazards maps. Landslide hazard map identifies areas that may be affected by landslides; floods were simulated at a 100-year rain return scenario; and storm surge simulation was based on maximum storm tide heights of 5 meters.

Data Source: Nationwide Operational Assessment of 17 Hazards - Development Mapping Resource and Information Authority

An NOAH Multi-hazard Map is a combination of landslide, flood, and storm surge hazard maps. The landslide hazard map, purposefully an input into possible incoherent sum map, landslide; no pagoda; dam; 100-year rain return scenario for pagoda; flood; wind storm surge simulation an storm tide height age needed for 5 narratives.
