COVID-19 Analytical Snapshot #29: Stigmatization and Discrimination UPDATE

Understanding the migration & mobility implications of COVID-19

This snapshot updates #6. These COVID-19 Analytical Snapshots are designed to capture the latest information and analysis in a fast-moving environment. Topics will be repeated from time to time as analysis develops.

If you have an item to include, please email us at research@iom.int.

Migrants’ stigmatization and discrimination in crisis situations

While it is true that the COVID-19 virus itself “does not discriminate” in its transmission, extensive research and reporting has shown that the pandemic has exacerbated pre-existing social and economic disparities, with migrants among the groups facing the additional burdens of stigmatization and discrimination. Refer to Analytical Snapshot #6 for more on earlier analysis.

Discriminatory mobility restrictions

The manner in which some countries/areas have implemented mobility restrictions is coming under increasing scrutiny, particularly in relation to migrants, including refugees.

Recent media reports show that measures such as curfews, in some locations have targeted specific groups of migrants. This has raised concerns that harsh restrictions aimed at migrants could hamper their ability to access basic care and services.

Xenophobic stigmatization

Stigmatization of migrants has led to a rise in xenophobic confrontations. The Asian Pacific Policy and Planning Council has documented 1,500 discriminatory and xenophobic incidents in the United States since the onset of the pandemic. Reports from several countries indicate that discrimination and anti-migrant behaviour has induced food insecurity and return migration to migrants’ origin countries.

Population surveillance: a COVID-19 legacy?

Many have raised concerns that once the current crisis has passed, governments could repurpose surveillance technology to track, monitor and discriminate against groups of interest, including migrants. However, in some countries the ability to surveil populations through the use of new technology already exists. In the US, for example, AI facial recognition technology is used by immigration authorities to conduct mass monitoring of people in traffic flows to detect undocumented migrants.

Addressing racism, discrimination and xenophobia

The Coalition of Latin American and Caribbean Cities against Racism, Discrimination and Xenophobia released a statement emphasizing the need for solidarity and addressing discrimination of vulnerable populations, such as displaced persons and migrants, during the pandemic.

Vulnerabilities at work

Migrants provide a significant labour source for essential industries. These workplaces have now become epicenters of COVID-19 transmission. For example, in the absence of adequate protection equipment has led to hundreds of outbreaks across the United States in places that disproportionately affect migrants.

In other sectors, migrants workers face a precarious employment status with only inconsistent access to social protection benefits.

Access to Health Care

Due to a range of explicit and implicit policies, migrants in many places face unique obstacles when attempting to access health care during a pandemic. Among other barriers, these obstacles include a scarcity of facilities, a lack of health insurance and fears related to immigration status.

Discrimination via environmental hazard

Two separate studies have given preliminary evidence that links long-term exposure to air pollution to increased vulnerability to COVID-19. Migrants disproportionately live in areas with high levels of pollution and environmental hazard.
